**MedCarousel**

Gain efficiencies in dispensing and inventory management

- Faster cabinet replenishment helps improve productivity
- Helps increase inventory turns and drive costs out
- Helps to reduce dispensing errors and improve safety
- Optimizes space for better access to medications
McKesson’s MedCarousel is a vertical, automated medication storage and dispensing system that’s ideal for pharmacies utilizing any workflow, where greater efficiency is needed. MedCarousel helps optimize floor space and medication inventory while supporting replenishment of automated dispensing cabinets, patient-specific dispensing, or both. Intelligent software increases inventory turns, helping to drive out costs, while automated processes enhance workflow, helping to reduce dispensing and restocking errors and improve safety and care.

**Helps improve productivity**
MedCarousel integrates with McKesson’s AcuDose-Rx®, as well as other medication dispensing cabinets, consolidating and centralizing medications for a more efficient and effective pharmacy. MedCarousel expedites restocking processes by replenishing cabinets up to three times faster through the advanced workflow of McKesson’s Connect-Rx® software. Orders are prioritized for technicians according to user specifications. MedCarousel’s utilities include cycle count, expiration date, and satellite replenishment functions. This streamlined workflow gives pharmacy more time to focus on other, more important tasks.

**Optimizes inventory levels, drives out cost**
MedCarousel allows pharmacy to gain more control over costs through device-specific Dynamic Inventory Optimization, which automatically determines PAR/MAX inventory levels for specified medications based on historical usage. Inventory turns increase by up to 65 percent, while helping to reduce stockouts and drive down the cost of drugs on hand. Optimization drives low inventory costs and high customer satisfaction by helping to reduce the incidence of expired medications while helping to ensure the right medications are on hand to meet patient needs.

**Helps reduce errors, increase speed and accuracy**
MedCarousel leverages bar code scanning and pick-to-light technology to help reduce dispensing and restocking errors by up to 96 percent. Faster, more accurate restocking of unused medications is achieved with bar-code scanning to identify medications and verify restock locations, while indicator lights guide technicians to the correct level and bin. MedCarousel contributes significantly to dispensing accuracy, helping to improve regulatory compliance.

**Greater storage capacity optimizes floor space**
With increased weight and line item capacity and up to twelve depths per bin, MedCarousel can store thousands of medications, helping to improve space efficiency by as much as 60 percent over static shelves. New hardware design features include enclosed carriers, lower power consumption, and other design enhancements to drive efficiency and economy. MedCarousel offers substantial workflow efficiencies, better cost control and improved security to support virtually any distribution model.
